Experience

ZopSmart Technology

August 2025 – Present

Software Development Engineer

- Architected a continuous, bidirectional **Go**-based sync engine to reconcile regulatory compliance rules with product catalogs, utilizing bulk database operations to process over **40,000+** items daily with zero data loss.
- Designed a reusable, generic partitioned worker pool using **FNV-1a hashing** to deterministically route items, preventing race conditions and improving parallel processing efficiency by **30%**.
- Ensured strict data consistency via database transactions and published near-real-time change events to an internal event queue (EHS), reducing downstream POS update latency by **40%**.
- Maintained broad code ownership across **5+** repositories spanning multiple business domains, authoring **Terraform** modules to provision **Azure** infrastructure (Event Hubs, Blob Containers) alongside Go microservices.

ZopSmart Technology

August 2024 – July 2025

Software Development Engineer Intern

- Developed 10+ **Go**-based microservices from the ground up to support core business operations, improving system modularity and reducing deployment times.
- Owned event-driven integrations by developing real-time publishers using **Azure Event Hubs**, successfully streaming business entity updates to 5+ downstream systems.
- Instrumented publishers with **Prometheus** metrics and **Grafana** dashboards, enabling real-time visibility into publish rates and latency, which reduced incident response time by **25%**.
- Orchestrated and managed microservices on **Kubernetes**, enabling scalable, resilient, and automated deployments.
- Automated secure data transmission by building **Linux**-based **SFTP** services, ensuring reliable delivery of program-eligible item data to external partners.

Education

Chitkara University

2021-2025

Bachelor of Engineering in Computer Science (CGPA: 9.1/10)

Punjab, India

Technical Skills

Languages & Frameworks: Go (Gin, Gofr), Java, SQL

Cloud & Infrastructure: Azure (Event Hubs, Blob Storage), Kubernetes, Docker, Terraform, Rancher, AWS

Datastores & Tooling: MySQL, Cassandra, MongoDB, SFTP, GitHub Actions, Harness, Prometheus, Grafana, Linux, Git

Concepts: Microservices, Event-Driven Architecture, Concurrency (Goroutines/Channels), Data Partitioning, ACID Transactions, REST APIs

Projects

Sharded LRU Cache

- Engineered a highly concurrent, generic in-memory key-value cache in Go, implementing an **LRU (Least Recently Used)** eviction algorithm using a hash map and doubly linked list.
- Reduced lock contention by partitioning the cache into 16 shards using **FNV-1a hashing**, utilizing **sync.RWMutex** to allow concurrent reads and thread-safe evictions.

Partitioned API Throttler

- Engineered a high-throughput API rate limiter in Go, utilizing **FNV-1a hashing** to partition client requests and a sliding-window algorithm to enforce per-IP rate limits.
- Exposed custom **Prometheus** metrics to monitor throttle rates and latency, containerizing the application with **Docker** for local deployment.
